

Scenario:

You are a student waking up for school, deciding what you should wear to school, you spend a lot of time looking into your closet and see nothing but random pieces of clothing that you don't know what to do with and you already wore your best outfits already and don't want to be repetitive. You scroll through images hoping to find an outfit that you could wear before you're late for school.

Task 1: Making an outfit based on the existing clothes you already have

Task 2: Be able to check all previously saved outfits

Task 3: Explore other users outfits and follow/saved their account

Notes:

What changes you should make to your application (min 3 Things):

1. Allow the user to be able to try on the outfits virtually
2. Instruction guide for new users so that they don't get lost
3. Have outfits planned for you throughout the week
4. Have a like and dislike section so that the app is able to learn what the user likes
5. When on the explore page or someone's account the app can tag where the article of clothing is from and it's price and if it can't find that specific one it'll give something similar

What you need to keep the same for your application (min 3 Things):

1. Browse through all saved items
2. Explore page so that the user is able to get more ideas on what to wear
3. To label photo and give them categories
4. Do keysearch for an article of clothing
